# Voyager EMISSIONS REPORTING

Free tool to capture the data you need to ensure your fleet is compliant.

The Voyager EMISSIONS REPORTING tool is a very easy way to capture the data you need to comply with EU MRV and IMO DCS.

- Start collecting data immediately
- Simple free on board tool
- Open format with full compatibility with third party
- EU MRV services including I.H.S Markit

The Voyager EMISSIONS REPORTING tool is a free app available in Voyager HUB and gives vessels everything they need to record the data required.

## How it works

Using the tool, vessels enter the specific data needed to comply with emissions related regulations. Data is entered on a per voyage basis including important cargo and fuel-related information. The data captured is securely stored in the Voyager CLOUD and accessed using GNS's free web based Voyager FLEET INSIGHT (VFI).

Using VFI, users can view and download the data the vessel has submitted at any time and used for in house purposes or provided to a 3rd party of your choice.

## What are EU MRV and IMO DCS?

**EU MRV** - EU Monitoring, Reporting and Verification of CO2 emissions (data collection started January 2018) **IMO DCS** - IMO Data Collection System on fuel consumption (data collection started January 2019)

Both EU MRV and IMO DCS requirements are mandatory, and intend to be the first step in a process to collect and analyze emission data related to the shipping industry.

**Enhance your shipping operations  
with data-led navigation**
